

M2M Intelligent PaaS Solutions

Introduction

Luminet provides over the top intelligent Value Added Services and Solutions for networks, aggregators, resellers and service providers. Our services and solutions add value to their enterprise customers by providing, visibility, control, insight and analytics to improve decision making on any application over any network technology.

Speed to Value

We add value to existing business models by providing visibility and control in network and application performance management, optimisation, quality of experience, service assurance, service level targets with enhanced performance and network monitoring at the network, APN, SIM and application layer.

This enables providers to offer value added services to their customers and to change the way they charge for value added services at the IP, application layer or byte increments. This deliver speed to value in their existing customer base and can create new differentiated business models.

This visibility combined with feedback loops into the Customers' portal, CRM and Sales functions enhances the engagement with customers and can enable our partners to up-sell new services in their portfolio as well as reduce churn.

Speed of Delivery

Our services are provided network side, not client side, and therefore are easy to integrate into existing networks as on premise or off premise PaaS on fixed or dynamic IP addresses inside the APN on a multi-access, multi-vendor and multi-country basis.

Because our services are network central we help providers deliver easily and quickly into their existing customer base as well as enable new differentiated value added services to be taken to market.

Presented in API streams and integrated with existing portals and VAS such as Maps and Location enable provision of engaging and insightful analytics to empower better decision making in enterprise's SIM portfolios.

Providing users with Insight, visibility and control is very valuable in lots of different use cases at a multi-access, multi-vendor and multi-country levels including:

- **Network and Performance Management**
SIM, APN, RTT, Latency, Jitter
- **Insight: Bandwidth and Applications**
Sim, Estate, APN, Bandwidth and Application usage
- **Optimisation**
Lock down & Block applications by SIM and time
- **Quality of Experience**
Condition any application for near real-time or real-time traffic prioritization experience.
- **Analytics**
API for integration and visualization, near real-time, real-time and historic trends

Support

- Fully managed
- Tier 3 24/7/365 NOC
- Wholesale billing
- 99.99% SLA
- Professional services
- Dynamic instances

PaaS On and Off Premise
